Project title : FADECI - Deforestation/degradation factors in Cote d'Ivoire - Qualitative analysis under the ONU-REDD program

Project place	Project cost	Role in the project	Technical and financial sponsors	Dates
Côte d'Ivoire	48 000 €	Coordination - Forest, agriculture, remote sensing expertise	REDD+ Permanent Executive Secretariat, FAO, BNETD - Bureau National d'Etudes Techniques et de Développement	March 2016 - November 2016

Project's goals and results

Main goals
In addition to the historical deforestation mapping conducted by the BNETD (Ivorian technical office), the FAO and the permanent Executive Secretariat of REDD+ mandated Nitidæ in order to identify and quantify the direct and indirect factors of the deforestation that have reduced Ivorian forests from 7,8 to 3,4 million hectares (10.6% of the territory) from 1990 to 2015. The study also focused on the analysis of forest degradation factors, another more worrying phenomenon in Cote d'Ivoire.

Specific objectives
- Identify and quantify direct and indirect factors of deforestation
- Identify and quantify direct and indirect factors of degradation

Beneficiaries
In the 7 Agro-Ecological Areas of Cote d'Ivoire, the analysis of the above factors has led BNETD and Nitidæ teams to consult nearly 400 people in various forms. It also allowed to identify and quantify the weight of the multiple direct and indirect factors of deforestation and degradation, at a national level and at the level of each Agro-Ecological Areas, in Cote d'Ivoire.
This study has been validated by an independent remote sensing work of the FAO and SEP-REDD +

Results
R1. On **deforestation** in terms of **direct factors**, the analysis confirms the very important weight of the agriculture expansion (mainly cocoa farming) in the process of deforestation of the last 25 years. This phenomenon being quoted at 62 % by surveyed persons and this proportion varies between 22% for the Eastern Area and 71% for the South East Area. Next come the exploitation of wood energy (29%), the spread of bush fires (23%) and mining (3%).
R2. On **deforestation** in terms of **indirect factors**, it is the categories of economic factors (36%) and political/institutional factors (35%) that are put forward by the persons surveyed. Then, comes the following category : demographic data (24%). In all categories, the first three factors cited are: Economic attractiveness of activities leading to deforestation (25%), Population growth, included migration (12.5%) and War / Political crisis (12%).
R3. On **degradation** in terms of **direct factors**, the analysis confirms the very important weight of timber exploitation, fairly distributed between sawing and industrial exploitation. This category is quoted at 46% by the persons surveyed and this proportion varies between 21% for the North Area and 71% for the South East Area. Then come the following categories : logging (cited at 29%), bush fire spread (23%) and mining (3%).
R4. On **degradation** in terms of **indirect factors**, it is important to note that the considerable weight of the category of political and institutional factors (53%), far ahead of economic (24%) or demographic factors (18%), even if the very first factor expressed in all categories is population growth, including migration (17%). The 2nd and 3rd most cited factors are: poor (or lack of) enforcement of laws and regulations (15%) and the crisis of the 2000s (14%).

Activities
A1. Identify the types of activity: deforestation or degradation
A2. Identify Agro-ecological Areas
A3. Identify the main direct factors of deforestation (cocoa farming, rubber cultivation) or degradation (sawing services, industrial exploitation, charcoal production)
A4. Identify perception differences from one stakeholder group to the other
