RONGEAD INITIATIVES

Investing in agriculture and ensuring a rewarding activity in a context of price volatility remains a challenge for the actors of the value chain. Disseminating a reliable, prospective and streaming information enables professionals of the industry to access to a first level of knowledge to make better decisions.

N'KALÔ: an integrated service of training, information and extension adapted for every link of the chain.

76 000 producers, 3 mobile operators, 130 farmers' organizations.

Service available in Ivory Coast, Burkina Faso, Mali, Chad, Senegal and Gambia on cashew, sesame, shea, maize, onion, groundnut, yam, cassava, plantain, Arabic gum and today around 76 000 producers receive at least 1 SMS / week on marketing advice.

Designed by RONGEAD, the H2CP is a pyrolysis reactor which turns cashew nut shells or other biomasses into efficient and environmentally friendly energy sources. Its advantages :

- Savings on energy costs in the industry: 20% of shell volumes of a shelling unit are sufficient to meet all the needs of the cashew processing.
- Renewable energy production: your industry's waste becomes by-products (biochar, briquettes...).
- Waste Clean Management of the cashew processing industry: more than 82% of burn-off emissions reduction
- H2CP is custom installed to best meet your needs :
- The H2CP works with shells and / or the De-Oiled Cake.
- Cashew industries or other industries which can source shells.

RONGEAD works at developing solutions fo energetic valorization of agro-industrial wastes in Africa (cashew, shea, mango...).

OUR ACTIONS IN

2015 VALUE CHAIN
SUSTAINABLE DEVELOPMENT

The agro value chains must respond to **increasing and multidimensional challenges**: food, economic, energy, environmental and social issues. In a globalized economy, pressure on natural resources increases and poorer populations' adaptive capacity has diminished. In 2015, RONGEAD led a series of actions to reinforce the capacity of local actors and to facilitate exchanges between stakeholders in order to better address these global challenges.

Exemples: In **Chad** and **Burkina Faso**, Non-Wood Forest Products (NWFP) such as honey, Arabic gum or shea, are part of the sources of income of local people. Supporting the exploitation of these products allows the creation of economic activities while preserving the environment. So RONGEAD and its local partners are working with farmers and local authorities as well as international buyers to define implementing conditions for sustainable and equitable value chains as recommended by the Union for Ethical Biotrade and the Nagoya Protocol.

During the support and advice missions to public or private partners, the expertise of RON-GEAD is mobilized to better take into account the constraints and the strategies for family farms in developing projects. By specific studies, RON-GEAD also promotes sustainable strategies for local food processing and development of value chains without deforestation, particularly in Ivory Coast and Mozambique.

INTEGRATION OF PRODUCERS IN THE MARKETS

growing price volatility, compounded by various issues: the globalization of markets, reforms in agricultural and food chains, climate change and emerging of new markets. Small producers, more specifically their revenues and investment capacity, are most affected by this volatility. Regardless of which regulation policies are implemented by governments, it is up to the actors of the international agro-food chains to integrate new management techniques, through a holistic approach combining an understanding of market factors with rational decision making.

Exemples: In order for small farmers, local and professional actors as well as public institutions to better understand and act within the global agricultural sector connected to markets, from local to international, RONGEAD develops an information and advice service on: cashew nut, sesame, shea butter, maize, onion, groundnut, yam, cassava, plantain, Arabic gum. This multiform service currently matures in **Ivory Coast, Burkina Faso, Mali, Chad, Senegal** and **Gambia** (76000 impacted producers).

In **Burkina** and **Ivory Coast**, income diversification of family farms requires increasingly hitech and innovative agrarian systems in order to respond to growing local demand. Commercial gardening and beekeeping can be relevant and viable production options once adapted to local markets.

The growing food demand of West African cities is an opportunity for family agriculture in these regions. To get the most of this opportunity, innovations are needed in the production, adaptation to the market and distribution organization. We support these changes through specific supports, analyses and diagnoses that put local value chains at the heart of these changes.

AGRICULTURE AND ENERGY

Agriculture plays a **major role within the new international climate and energy frameworks**. Better integration between agricultural and energy production is to imagine. The technological innovations developed by RONGEAD seek to integrate economic, environmental and social dimensions to improve access to sustainable energy within production value chains.

Based on its experience to develop agro-industrial waste re-use solutions for cashew and shea processing industries in Africa (see inset on H2CP initiative), RONGEAD is working to strengthen **local capacity** for **innovative industrial equipment** development for sustainable agro-industry and energy production for development.
